

Observations

There are 3 observations I can see from this data. First, the closer to the equator to the equator you are the more humidity there is. The scatter plot Latitude vs Humidity shows the further from 0 left and right the lower the humidity there is. Second, The max temperature is lower the further away from the equator you are. The scatter plot of Latitude vs Temperature show the further away from zero the lower the temperature. Lastly, It does not matter how close or far you are away from the equator you are to determine wind speed. The scatter plot Latitude vs Wind Speed shows both high and low wind speed on both the right and the left of the chart.
